Unsourced material may be challenged and removed. Widely used for both sport and hunting it has proven itself to be both accurate and reliable. It is an unregulated, pneumatic powered air gun available in both .177 and .22 calibres and with a choice of either single shot or multishot. It is one of the cheapest PCP air rifles available in the market. It was designed by BSA designer John Bowkett. It comes equipped with scope mounts and silencer. Stocks in Beech and Walnut available as is a black synthetic stock. It is designed to be a lightweight stalking gun used for hunting vermin like rats and pigeons in cramped areas. It provides a twostage, adjustable, match grade trigger which can be adjusted to provide a light pull weight. It has a manual safety to avoid accidental discharge. The

MMC is operated by means of a plunger at the fore end of the stock. In the UK, it is also available in FAC versions requiring a firearms

licence. <http://futuretradingnepal.com/cmsimages/82-mitsubishi-tv-manual.xml>

Therefore, pellet speeds vary according to the pressure of the cylinder. The Ultra is equipped with a small cylinder, thereby providing very low shot count compared to other pneumatic rifles. The lower shot count in .177 is because .177 pellets travel at higher speeds than .22 and hence more charge is required to power them. It is now possible to get aftermarket pressure regulators fitted to Ultras which give up to 100 full power 12 ft pound on one charge. This uses the BSA standard 10 shot rotary magazine. The MMC system allows the shooter to reload the rifle without taking the eyes or the rifle off target, thereby allowing the shooter quick followup shots. Separate after market fitments for regulators and bigger cylinders are available. The MMC action also did not enable the shooter to keep on target as the switch to release the probe was under the nose, then the probe would come out in a position behind the shooters ear. Then the probe would have to be pressed in if using a multishot not allowed when engaged in target shooting competitions or a pellet rolled into the breech, then the MMC would have to be pulled back, lifting the barrel. Also, if the shooter wanted a bipod the best way was to put it on backwards so that the legs when folded point towards the trigger. The twostage multishot system MMC has been replaced with a traditional bolt action assembly that increases the reload speed, and makes fitting and using a bipod considerably easier due to the removal of the front plunger style cocking system. The factory fitted sound moderator has been replaced with a muzzle brake. The safety has been moved from the right to left hand side so as to not interfere with the bolt action. A pressure gauge is now present on the underneath of the stock, which enables the user to see how much charge is in the rifle. By using this site, you agree to the Terms of Use and Privacy Policy. Moderators. My original plan was to get a BSA Ultra but the increased shotcount of SE and the bolt action. The single shot model is ideal for pest control, but especially so when used from a confined hide or when shooting from a 4X4 vehicle. Its also just the ticket for younger shooters, who might find a fulllength rifle, or even a conventional carbine a little cumbersome. Me, well I just love em, as theyre compact and pointable, but not too light to be skittish whilst on aim. I find some small, light air rifles to be great as far as carrying them around is concerned, but a real pain to keep still when shooting, as theres not enough heft to keep them still. Other shooters swear by them, so its horses for courses I guess. The two stage cocking and loading is also something you either love or hate too, and once again its to my liking.

The bolt is opened via a small catch on the right hand side of the breechblock, which allows the springloaded pellet probe to move rearwards. A pellet is then placed in the loading trough in the conventional way, and the probe pushed forward with the thumb. Even though theres one up the spout, the action isnt cocked until the Micro Movement plunger, positioned in front of the forend, is pushed back. This action was originally used on the BSA Hornet, but as it was a conventionally sized carbine, and later a rifle the forward hand has to be moved from its position on the forend to make the rifle ready. I wasnt bothered by this, as I simply slid my hand forward, cocked the action, and then returned it to where it was. The 10 shot magazine from the Super 10 was later incorporated into the Hornets action, but once again; the leading hand had to be placed rather unnaturally at the tip of the forend, or moved to cock the action. It is therefore possible to load and cock this little gem, without moving either hand from the stock. The photo of the action removed from the stock shows clearly how the cocking knob is connected to the twin steel rods, which in turn impinge on the hammer during the cocking process. The BSA ten shot magazine has had a bit of a redesign lately, but youd be hard pressed to tell, as outwardly the old and new look identical. However, those in the know assure me that the new internal components will enhance reliability and longevity. Pellets are loaded one at a time into the internal cylinder, which is rotated against spring pressure, to reveal another waiting chamber. This process is repeated until all ten are full. With the probe rearward, the clip is slotted into the left hand side of the breach block, and retained by a sliding catch, located in front of the left hand side of the breechblock. As the pellet probe is pushed forward, a pellet is stripped from a chamber in the magazine, and fed directly into the hammerforged barrel.

When the action is cocked via the cocking knob, a small steel pin moves up and presses on the release catch in the magazine; this allows the internal magazine wheel to rotate the next time the pellet probe springs back. This may all sound a little complicated, but trust me, its not. In use, its a sweet action, just different to what most people are used to. The tried and tested, twostage trigger unit has been retained, and its a precise mechanism, that can be set to give a very light release should that be required. This is fine for range use, but for use in the field, a heavier pull is to be recommended, especially if you suffer from buck fever. The safety catch is also identical to previous models, and can be set and reset as required, by thumbing it backward for safe, forward for fire. Compared to when I tested the first Ultra, the beech stock has had a bit of a make over. The pistol grip isnt quite as upright as before, but is still comfortable to hold, and a groove runs up the rear for those that use a thumb up hold. The belly of the forend is now deeper, which reminds me of the old Weihrauch HW35 furniture, and fills the hand nicely. The scopeheight cheekpiece now has a sort of double curve at the bottom, which is both attractive and distinctive. The butt is finished off with the usual ventilated rubber pad, which has the BSA logo moulded into it. Chequering is now laser cut, which is a feature found on a lot of airguns these days, and its a welcome addition on the Ultra Multishot too. Panels adorn both sides of the forend and grip, with the BSA piled arms motif etched into the base, which was first seen on the Lightning XL spring piston rifle. The plus side of this is that shot count goes up a bit from 40 to 45 per fill. Half of the unit comes back round the barrel, in a similar way to many fullbore models, but it doesnt increase capacity as the latter do.

The end result is that although the trademark discharge of a pre charged pneumatic is reduced, its hardly tamed. It must be a bit of a dilemma for the designers keep the package compact, but compromise moderation; or increase moderation to the detriment of size. Potential purchasers will have to decide which way they go, but when you consider that most vermin species tackled with an air rifle end up dead, do they really care how noisy the gun was that just put their lights out. Also, the pellet striking the head of a rat or rabbit makes quite a thud, and even when using the quietest of airguns, the mates of a fallen comrade often scarper at the sound of the pellet hitting home, and the fact hes flipping around on the ground for a while despite the fact hes dead. As the silencer is included in the price along with a set of quality mounts its up to the buyer to upgrade or not. The combo was kept safe and secure in a BSA Backpack rifle case. The black woven nylon exterior is well made, and has accessory pockets on one side, that can be used to carry buddy bottles, silencers etc, and theres a large zipped section that could carry target cards, shooting permission letter etc. Conventional handles are stitched to the case, but there are extra straps included that allow the user to carry it on their back like a rucksack. Twin Orings form an airtight seal as soon as the divers bottle valve is opened, with 200 bar being the required pressure. Over the chronograph, the results were impressive, with very little shot to shot variation over the sweet spot in the power curve. Ragged onehole groups at 30 yards are pretty much industry standard these days for air rifles, so I wasnt at all surprised by the groups I achieved. I had to help get rid of a quantity of rats on a local farm, so once Id worked out where they were appearing from, and the ranges involved, I settled on a 15 yard zero.

Shooting them at such short ranges may sound easy, but when theyre darting about from one piece of cover to another, at quite remarkable speeds, its challenging sport. They just refused to stop still for long, even with some tasty treats provided as bait. I managed to shoot a few on each evening visit though, so their numbers are gradually being reduced, but I think Ill be kept busy over the coming weeks. I could therefore have extra illumination at the press of a button, and a red laser dot to pinpoint the rats if required. With the pressure switch for the torch fixed to the forend, and the one for the laser under my thumb, it was possible to zap the rats as soon as they stood still. The light produced by the unit seemed a bit too bright, as it seemed to startle the quarry as soon as I switched it on, so I reduced it a bit by scribbling on the lens with a marker pen. The Ultra action cycled faultlessly, but could be a bit noisy in the enclosed spaces I was using it. However, I found that if you slow the opening of the pellet probe with your thumb, it quietens things a treat. Many shooters still think multishots are for fast fire shooting; as far as Im concerned, this is incorrect; as what they really give you is the ability to load and fire with ease, even in the dark, with a quick back up shot should it be required. Controlling vermin with an air rifle is still about one shot, one kill; not blasting away as fast as you can. The newstyle furniture is well designed, and compliments the wellbuilt, reliable action. The twostage cocking and loading may not be to everyones taste, but trust me, you soon get used to it; and once youre accustomed to it, it becomes second nature. The only downside to this airgun is the standard silencer, but you get it as part of the package, so you can upgrade to something more efficient if you wish.

Air rifles dont get much more compact than this, so if you need one thats compact and punches above its weight, the Ultra Multishot is just the thing. Well done BSA. Had a couple of jamming issues but later found out it was more me than the rifle duh. Just spent weekend with my son hatsan at4410 user and between us we cleared just over 170 rats on the farm. Bsa yet again have brought another rifle onto the market witch does as it says on the tin. If you set this rifle up correctly she will make you grin time and time again, Over all 10 out of 10 bsa, compact, light weight, powerfull, cost freindly, easy to us and a dam attractive rifle to have. P.s for those who dont have night vision, GET IT. Soft popping noise and have shot a dozen rats so far. Easy to use and can stand for 10 mins holding it to aim is so lightweight. Perfect for my needs. It may not display this or other websites correctly. You should upgrade or use an alternative browser. Please take the time to read them; it

The BSA Ultra came in many variations and this version came with a slightly longer pressure tube than what you see pictured. Also this gun did not come regulated from the factory and a HUMA regulator was installed. Now I had this gun prior to HUMA offering a reg for it. With such a small pressure tube, the regulator made a big difference. The gun came with a 10 shot metal magazine, fill probe, small package of moly lube, 2 replacement orings for the probe, instruction manual and a media dvd. The newest model BSA magazines have a plastic rotor versus the older metal rotor magazine. The newer magazine rotors work great and I like the plastic rotor because they reduce the wear on the pellet probe oring as it cycles in the magazine and also reduces the chance of damaging the pellet. The new magazines have not failed me yet. The gun I chose came with a beech wood stock with nice checkering and laser etched BSA logo. I quickly replaced it with a synthetic tactical stock that is very solid and durable as soon as I got my hands on one nearly a year later. The finish is not shiny and has a texture that does not feel slippery. Anyone familiar with these stocks know the detail BSA went into to make it a winner. The stock has a swell in the palm grip to fill in the space and make the gun more comfortable and stable to shoot. The newer tactical stocks are all ambidextrous, but the earlier stocks were either left hand or right hand. The older ones also had a nice thumb scoop, which I prefer. The new stocks do not have thumb scoops, but feel good nonetheless. The wood stock has a metal trigger guard while the tactical stocks have a molded in plastic guard. The trigger blade is made of metal and is two stage adjustable. These triggers can be set very light and have a crisp clean break. Rowan Engineering makes a replacement trigger that

has even more adjustability to fit every shooter's needs. The gun is cocked by pushing a plunger in the front of the stock towards the buttstock.

But that's not all! In order for the gun to shoot a pellet, you must also flick a small finger lever to release the spring operated plunger style pellet probe. Once the lever is released the probe pops backwards allowing the magazine to cycle under spring tension to the next pellet. Once the magazine has presented a new pellet for loading, the user must push the plunger forward to move the pellet into the very famously accurate hammer forged barrel. BSA makes their barrels in house using a hammer forging from machines that are used for their military and sporting rifles. They claim 35,000 hammer blows to form this barrel. The hammer forging process also forms a natural choke in the barrel. This is what I think provides a consistently accurate barrel making process. Anyway, the action has a manual safety catch, which should be set to the fire position when the owner is prepared to shoot the target. The action has an 11mm dovetail scope mount. No other sights or mounting options are included. For the purpose of this write up I decided to slap on a cheap scope and mounts made by Barska. The pressure tube can be filled to 232 bar. This model gun did not come with a factory pressure gauge, I added this gauge which was made by TENCH in the UK. Since I added the regulator I have no problem bumping that up to 250 bar. That's less than 20 bar difference from the manufacturer's recommendations. As a rule of thumb, it is ALWAYS safer to use a fill pressure according to the factory manual. As I mention before this pressure cylinder is slightly smaller than the one that came with this gun, but the original wasn't long either. The BSA sportsman, Hornet, and Gamo Dynamax shared the same action, but with longer pressure tubes, barrels, and stocks. In the following pictures you will see three of the different actions I have acquired over the years which basically use the same principle operation of the MMC system.
